### **Feedex's Latest Technology Fattens Up Cattle with Proper Nutrients**

Midway, Idaho--July 18, 2005--Edward Mayer, an Idaho cattle rancher, enlisted the help of a friend and animal nutritional feed engineer, Don Newbury, to help him improve the health of cattle on his ranch. Together, they brainstormed and came up with the Feedex system. The results were so spectacular that they had to share it with others who were commercial cattle raisers. Inadvertently, Feedex Industries was born. Today, Feedex markets the only chemical -free nutrition system that works for cattle.

The Feedex Nutrition System works for anyone who has a cattle population, from farmers and ranchers to feed production companies, veterinarians, dairy farmers and rodeo producers. Any venue that involves cattle can eliminate the problem of poor nutrition. Government departments, schools and public works all have a responsibility to monitor the nutritional habits of marketable livestock. It inadvertently impacts the nutritional value of beef consumed by children and adults. Consuming unhealthy or steroid-injected beef with chemical additives can compromise the health of the entire human population.

The Feedex System is an aggressive approach to elevating the health of American cattle as well as cattle raised on foreign soil. Marketed exclusively to the cattle-ranching industry in the past, it's now available to the mass market where nutrition problems exist for cattle populations anywhere. Inventor, Edward Mayer says, "We thought if farmers and ranchers could solve their problems with our system, anybody else could also. With this system you do not wait for the cattle to become malnourished or chock full of steroids and chemical-laced feed, you institute the system directly to prevent poor nutritional health."

Patented and registered with the EPA, the Feedex system comes in giant barrels that are sized according to the number of herds and heads to be fed. Barrels can be customized to meet the needs of small farm/ranch/rodeo operations to large commercial cattle-ranches. Cost of the feed is pennies per head for a six-month's supply. The barrels have a built-in feed dispenser that works by pushing a button that shoots a calibrated mixture of high-density all-natural vitamins and minerals down through the feed troughs. Presto. The cattle receive the exact correct mixture for achieving optimum nutritional balance. An all-natural preservative mixture allows feed to remain fresh for up to a year.

The Feedex features the latest advances in solid-state electronic ignition controls and circuitry. It allows the operator to create an instant log of animal's approximate weight and measurements and how much Feedex was ingested. The system is non-toxic and contains no chemicals. The archaic practice of fattening up the livestock with mealy fillers and steroids is no longer needed.

Derek Brown of Wildlife Damage Control in Washington, D.C. said, "The Feedex system has been a great boon for me in my line of work. Keep up the good work!" Rebecca Bailor, editor of The Cattle Manager Magazine dubs it "The Best System that has come down the pike for producing healthy cattle with the minimum of fuss. It will addict you to Feedex forever."

For further information or to order the Feedex system, call 800-756-4519 or visit the Web site: <http://www.feedexindustries.com> or email: [sales@feedexindustries.com](mailto:sales@feedexindustries.com).
